Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will

Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation
- by stereoselective hydrolysis of corresponding racemic amide using
- by stereoselective hydrolysis of corresponding racemic amide using
- by stereoselective hydrolysis of corresponding racemic amide using
- microorganism or derived enzyme, used as drug intermediate

Claim 7a; Page 32-34; 68pp; German.

This DNA sequence encodes a R-specific amidohydrolase isolated from
the sequence encodes a R-specific amidohydrolase is used in a process for preparing
(R)-isoforms of 3.3-trifluoro-2-hydroxy-2-methyl propionamide which
is cheaper than prior art optical resolution of the racemate using
dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
Sequence 1442 BP; 385 A; 350 C; 370 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 181 acgtggagaataacatatgaaatggttggaagaatccattatggccaaacgcggtgttgg 240

Claim 7; Page 4-5; 24pp; German.

Between this 3* end sequence and the 5* end sequence of N80036 are
ca. 200 bp not represented in the specification.

The nad A sequence (N80035) encoding a polypeptide with the biological activity of quinollinic acid synthase, together with nad B encoding a polypeptide with the biological activity of L appartate is inserted into polypeptide with the biological activity of L appartate is inserted into pharmaceuticals and plant protection agents.

Discussion by Carman.

To codes for guinolinic acid synthase. Also claimed are nadB which codes for L-aspartate oxidase and genetically transformed microorganisms contg. Pasmids bearing nadA and nadB DNA in a copy ratio of 50:200, 8:50 or 8:200. Isolated chromosomal DNA was digested with HindlI to obtain 6 and 8 kb fragments, which were inserted into PBR322 and cloned in E. coli NK6042 to obtain plasmid pQAB510. This was digested with HindIII and NruI cto obtain a 3.2 kb fragment, which was inserted in pBR322 to produce pQAB 520. This was digested with Spi and NruI to obtain a 2.5 kb fragment, which was inserted into phr234 cc 520. This was digested with Spi and NruI to obtain a 2.5 kb fragment, cc pt and BamHI to give a 2.5 kb fragment, which was inserted into phr234 cc optain pQAB12. This was digested with AluI, ligated with HinciII-cleaved cobtain pQAB12. This was digested with AluI, ligated with HinciII-cleaved cc obtain pQAB12. This was digested with AluI, ligated with HinciII-cleaved cc pUC18 and cloned in E. coli 431 to give pQAA166. This was digested with BamII and PStI to isolate a 1.4 kb insert, which was inserted into PStI cc obtain the nadA-contg. plasmid pQAA16. The BamII and PStI to isolate a 1.4 kb insert, which was inserted into PStI cc Transformation of E. coli w434 to give pQAA166. This was digested with a 50:200 copy ratio, glving quinollinic acid in yields which were ca. 2.6-2.8 times those obtained using w446. The calid swhich were ca. 2.6-2.8 times those obtained using w446. The calid is an intermediate for pharmaceuticals and plant protection agents. Sequence 1724 BP; 408 A; 432 C; 470 G; 414 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 1; Page 6; 24pp; English.
The sequence is that of a PCR primer which was used in the amplification of a ca. 900 bp long fragment, pBM37, contg. the C-terminal end of lacS from FspI linearised pDP228. The primer introduces a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           It codes for quinollinic acid synthase. Also claimed are nadb which codes for quinollinic acid synthase. Also claimed microorganisms contging Laspartate oxidase and genetically transformed microorganisms contgiplasmids bearing nada and nadb in a copy ratio of 200:50 or 200:8.

Transformation of E. coli W4546 successively with pQAB 520 and pQAA produced a transformant with a 200:50 copy ratio, giving quinollinic acid in yields which were ca. 7.5-9.7 times those obtained using W4546. The microorganisms give high yields in a reproducible manner. Quinollinic acid is an intermediate for pharmaceuticals and plant protection agents. Sequence 1724 BP; 408 A; 432 C; 470 G; 414 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  24-JUL-1990 (first entry)
The nadA nucleotide sequence used in effecting prodn. of quinolinic acid Quinolinic acid production; nadA; nadB; pharmaceutical intermediate; plant protection agent intermediate; quinolinic acid synthase; L-aspartate oxidase; Escherichia coli W4546.
                                                                                                                         Trifluoro-2-hydroxy-2-methyl-proplonic acid enantiomer preparation
by stereoselective hydrolysis of corresponding racemic amide using
microorganism or derived enzyme, used as drug intermediate
claim 7a; Page 32-34; 68p; German.
This DNA sequence encodes a R-specific amidohydrolase isolated from
Klebsielha oxytoca strain PRS1 which allows the microorganism to
utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole
nitrogen source. This amidohydrolase is used in a process for preparing
(R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which
is cheaper than prior art optical resolution of the racemate using
dimethoxy strychnine or (S)-(-)- alpha methylbenzylamine.

The sequence is that of a PCR primer which was used in the amplification of a ca. 700 bp long fragment, pBM38, contg. the C-terminal end of lacS from FspI linearised pDP228. The PCR amplification was performed as part of the construction of donor plasmids for the integration of the cat gene into the lac operon.

Human haematopoletic stem cell growth factor coding sequence. Haematopoletic stem cell growth factor; SCGF; burst-promoting activity; BPA; granulocyte macrophage colony stimulating activity; gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymerase chain reaction, PCR, primer; amplify; stable; integration, homogenic; heterogenic; Streptococcus thermophilus; restriction site; donor plasmid; artificial; milk product; yohgurt; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
The sequences given in 051467-72 are primers which were used in the stable integration of homo- or heterogenic genes into the Streptococcocus thermophilus genome. These plasmids which allowed insertion sites within donor plasmids which allowed insertion of the required genes into the S. thermophilus genome. S. thermophilus transformed in this way may be used in the production of an artificial milk product, especially yohgurt. Integration is stable and follows a strict copy number control of the host genome. The integrated gene may be expressed without the need for direct selection, observable phenotype or adaptation of the growth medium. Sequence 26 BP; 4 A; 5 C; 3 G; 14 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The metal sequences given in 051467-72 are primers which were used in the stable integration of homo- or heterogenic genes into the Strable integration of homo- or heterogenic genes into the Streptococcus thermophilus genome. These plasmids which allowed insertion sites within donor plasmids which allowed insertion of the required genes into the S. thermophilus genome. S. thermophilus transformed in this way may be used in the production of an artificial milk product, especially yohgurt. Integration is stable and follows a strict copy number control of the host genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The integrated gene may be expressed without the need for direct selection, observable phenotype or adaptation of the growth medium. This sequence encodes the human haematopoietic stem cell growth factor (SCGF) of the invention. The polypeptide of the invention is of mammalian origin and has haematopoietic stem cell growth factor SCGF activity, including burst-promoting activity (BPA) and granulocyte macrophage colony stimulating activity (GPA). The products can be used for treatment, diagnosis and analysis of haematopoietic cell disorders and bone marrow inhibition, e.g. by cytotoxic anticancer agents such as 5-fluorouracil. The products can also be used for amplification of haematopoietic cells in vitro, e.g. for use in marrow grafting and gene therapy by insertion of SCGF gene using a suitable therapeutic vector. Breakthrough strains - useful in providing added protection against HIV not provided by original vaccine

Claim 6; Page 112-114; 193pp; English of the provided by original vaccine

Clone C15.3 encodes a gpl20 envelope polypeptide (see W37059) of a breakthrough isolate of HIV-1 obtained from an individual infected with HIV-1 through high risk activity while participating in phase I or phase 2 trials of MN-rappl20, a candidate recombinant appl20 HIV-1 vaccine. Nucleotide sequences (see V00517-30) for gpl20 polypeptides (see W37054-67) were obtained from 2 clones of each of 7 breakthrough isolates. The envelope glycoprotein genes
                                                                                                                                                                                                                                Haematopoletic stem cell growth factor - useful for, e.g. treatment and diagnosis of haematopoletic cell abnormalities and bone marrow inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20-JUL-1998 (first entry)

Clone C15.2 encodes a gp120 envelope polypeptide (see W37058) of a breakthrough isolate of HIV-1 obtained from an individual infected with HIV-1 through high risk activity while participating in phase I or phase 2 trials of MNI-rgp120, a candidate recombinant gp120 HIV-1 vaccine. Nucleotide sequences (see V00517-30) for agp120 polypeptides (see W37054-67) were obtained from 2 clones of each of 7 breakthrough isolates. The envelope glycoprotein genes were obtained from proviral DAA using PCR (see V00533-38). All 7 envelope glycoproteins possess sequences typical of subtype (clade) B viruses. The overall homology with MNI-rgp120, is 69-80%. Use of the gp120 polypeptides from one or more of the breakthrough isolates, usually together with MNI-rgp120, can provide protection against HIV strains that are sufficiently different from the vaccine strain (e.g. MNI-rgp120) that the vaccine does not confer protection against those strains.
                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                 (clade)
                          envelope glycoproteins possess sequences typical of subtype (clade by futures. The overall homology with MN-rgp120 is 69-803. Use of the gp120 polypeptides from one or more of the breakthrough isolates, usually together with MN-rgp120, can provide protection against HIV strahms that are sufficiently different from the vaccine strain (e.g. MN-rgp120) that the vaccine does not confer protection against those strains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                          New isolated Enterococcus faecalis polynucleotides - used to develop products for the detection of Enterococcus and for use in vaccines products for the detection of Enterococcus and for use in vaccines of products for prevention or attenuation of Enterococcus infection (laim 1; Page 219; 301pp; English.

The present sequence encodes an antigenic polypeptide fragment asolated from Enterococcus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                       compounds to identify agonists and antagonists of E. faecalis
      20-APR-1999 (first entry)
Enterococcus faecalis EF121 gene fragment.

X20248 to X20402 represent polynucleotide sequences isolated from Borrelia burgdorferi (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of biosynthetic products, e.g. enzymes. Borrelia belongs

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the Poplar (Populus trichocarpa)

orafleoyl-Coh-O-methyltransferase (CCOAOMT) promoter, PtCCOAOMTI, of the invention. The promoter is specific for plant or tree living vessel elements and/or xylem adjacent ray cells. The promoter is used in genetic modification to provide transgenic plants having altered lighin level and/or composition, which improves digestibility of forages and pulping properties of trees.
to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endemic relapsing fever, and Lyme borreliosis, more commonly known as
                                                                                                                                                                                                           Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (14-DEC-1998) to the DDBJ/EMBL/GenBank databases. Yutaka Kawarabayasi, National Institutte of Technology and Evaluation, Biotechnology Center; Nishihara 2-49-10, Shibuya-ku, Tokyo 151-0066, Japan (E-mail:kyutaka@kazusa.or.jp, Tel:+81-3-3481-8951, Fax:+81-3-3481-8424)
Kawarabayasi, Y. is officially affiliated with the National Institute of Bioscience and Human-Technology, Tsukuba, Ibaraki 305-0046, Japan.
Nomura, N. and Sako, Y. are at Kyoto University, Sakyo-ku, Kyoto 606-8502, Japan
Nomura, N. and Sako, Y. are at the National Institute of Technology and The other authors are at the National Institute of Technology and The other authore with Hength 100 codons or more between ATG or GTG and stop codon are defined as CDS
Homology analysis is performed by Smith-Waterman algorithm against GenBank and GenBept release 109; EMBL release 56.0; SwissProt release 36.0; PIR-Protein release 57.0; and OWL release 31.0.

WELL, http://www.sanger.ac.uk/Projects/S_pombe/)
Luring 1995 to 1996 about 66% of S. pombe chromosome 1 was
During 1995 to 1996 about 66% of S. pombe chromosome 1 was
sequenced by the Sanger Centre. The sequencing of the S. pombe
genome is now being continued with funding from The European
Commission. Fourteen Buropean sequencing laboratories, including
the Sanger Centre, are participating in the project.
Protein coding regions (CDS) have been predicted with the help of
computer analysis using the Genefinder program in PomBase (an ACEDB
database) with additional predictions for the branch-acceptor sites
supplied by the program 8538plice. CAUTION: It is possible that for
any individual CDS we may have underestimated or overestimated the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              alpha-galactosidase; amidase; amino-acid permease; flavohemoprotein; formamidase; globin; oxidoreductase; protein-1-isoaspartate o-methyltransferase; sodium:solute symporter family; sulfate permease; sulfate transporter family; TFI LTR; urea active transporter.
